Now suppose A and B to coincide. By the preceding lemma the angle $\angle dAb$ vanishes — the chord and tangent directions merge. Therefore the right lines Ab, Ad (which are always finite) and the intermediate arc Acb squeeze together and coincide, becoming equal among themselves. But the original chord AB, tangent AD, and arc ACB are always proportional to these finite three; hence they too must ultimately stand in the ratio of equality, arc : chord : tangent $\to 1 : 1 : 1$. This is the crown of the section: as $B \to A$, arc, chord, and tangent become interchangeable, and every later argument about velocities, forces, and curvature rests upon this single equality. *Q.E.D.*
