By Law I the body leaving B would run straight on to c (so Bc continues the line AB), yet it turns to C: some impulse deflected it by cC. Now $\triangle SBc = \triangle SAB$ because Sc and AB share the base SB and Bc lies on AB; but we are GIVEN $\triangle SBC = \triangle SAB$, hence $\triangle SBC = \triangle SBc$. By Euclid I.40, equal triangles on the same base SB lie between the same parallels, so C and c are equidistant from line SB — that is, $cC \parallel BS$. The deflecting impulse (by Law II, along cC) therefore points exactly along BS, straight toward the centre.
