

Within the figure Newton inscribes **the parallelograms** Ab , Bc , Cd , each raised on one of the equal bases and reaching upward only to the lower vertex of **the curve** on that base. Because **each inscribed rectangle** stops short of **the curve**, their united area — the step-figure $AKbLcMdD$ — lies **entirely below** it. Thus **the inscribed figure** is a deficient approximation, always less than the true curvilinear area.
