

Draw the tangent at P and the **conjugate diameters** DK and PG : a pair through the centre C where each runs parallel to the tangent at the end of the other. Let Q be a body-point near P , with the ordinate Qv dropped to the diameter PG , and complete the **parallelogram** $QxPR$. This is the ellipse's version of the QR construction of Prop. VI, whose nascent limit measures the deflection. By Lemma VII the **chord** SP and its tangent coincide in the ultimate ratio, licensing this passage to the limit.
