

By Prop. I and Cor. 4 the **centripetal force** in a least arc is as the versed sine of that arc taken in equal times. By Lemma VII the versed sine is as the **arc squared** divided by the diameter, so F answers to **arc**²/ D . Since the arc is as $v t$ and the diameter is as the **radius**, the times cancel and the diameters give the r , leaving the v^2 standing as the heart. The proof chain therefore closes on $F \propto v^2/r$.
