

The alteration of motion is ever proportional to the motive force impress'd: "if any force generates a motion, a double force will generate double the motion," and a triple force triple the motion. This holds whether the force be impress'd altogether and at once, or gradually and successively. The exact scaling is the heart of the law — $\Delta(\text{motion}) \propto F$ | *the seed from which* $F = m a$ *grows*.
