

Below sits the second figure $PprT$ with its own rank of three parallelograms on the equal bases PQ , QR , RT of the baseline PT . Notice that the curve prT leans the other way — it descends from p toward T — so this figure is shaped quite differently from the first. Yet it carries the *same count* of strips, which we name q_1 , q_2 , q_3 in order from P toward T . The whole point of Lemma IV is that the figures may differ wildly in form, provided their corresponding strips agree in ultimate ratio.
