

Compounding the pieces, the rectangle $PvG : Qv^2 = PC^2 : CD^2$, and by the similar triangles QxT, PEF we get $QT^2 : EP^2 = PF^2 : CA^2$; joining these with Lemma XII forces $L \cdot QR/QT^2 = SP^2$. Substituting into the Prop. VI measure $F \propto 1/(SP^2 \cdot QT^2/QR)$ makes it become $1/(SP^2 \cdot SP^2)$ divided cleanly, so the force varies as $1/SP^2$. Thus the distance SP to the focus alone governs the pull: the same inverse-square law that Newton would recognise as universal gravitation holds every planet in its Keplerian ellipse.
