

Compounding the pieces, the rectangle $PvG : Qv^2 = PC^2 : CD^2$, and by the similar triangles QxT, PEF we get $QT^2 : EP^2 = PF^2 : CA^2$; joining these with Lemma XII forces $L \cdot QR/QT^2 = SP^2$. Substituting into the Prop. VI measure $F \propto 1/(SP^2 \cdot QT^2/QR)$ makes it become $1/(SP^2 \cdot SP^2)$ divided cleanly, so the **force varies as $1/SP^2$** . Thus the **distance SP** to the focus alone governs the pull: the same **inverse-square law** that Newton would recognise as universal gravitation holds every planet in its **Keplerian ellipse**. *Q.E.I.*
