

Proposition VII is the first concrete application of the force-measure proved in Proposition VI, now applied to the simplest curvilinear orbit: the circle  $VQPA$ . A body  $P$  revolves in the circumference and  $Q$  is the next place into which it moves. The remarkable freedom here is that the force centre  $S$  need not sit at the centre  $O$  — it may lie anywhere inside the circle, and we still seek the law along the radius  $SP$ , which is the distance whose powers Prop. VI taught us to track.
